6 November 2014

Salt Group's mobile token for 2FA authentication solution is extended with multi-language support

Salt Group is pleased to announce the introduction of local language support for the Asian region with their Salt mCodeXpress mobile-based second factor authentication product, beginning with Indonesian and Mongolian, and with plans to further expand the language support to Vietnamese and Mandarin Chinese.
The introduction of the Indonesian and Mongolian language supports Salt Group's expansion to Jakarta through its distribution partner Berlian IT and up to Mongolia, to meet the growing need and potential regulatory requirements for strong 2FA authentication in the financial services arena in the region.

"We are pleased with the expansion of language support in Salt Group's Mobile product for the Indonesian and Mongolian markets to further support the technology within their financial services arena," Ross Oakley, Managing Director, Salt Group.

About Salt mCodeXpress

Salt mCodeXpress is a convenient mobile-based "second factor" authentication (2FA) mechanism used in conjunction with Echidna to provide an out-of-the-box solution for high assurance authentication of remote users connecting to enterprise networks via VPNs, Citrix gateways or other RADIUS aware access points.

Salt mCodeXpress generates One Time Passwords (OTP) and offline Challenge Response Signature Codes that are displayed on mobile devices.

Salt mCodeXpress provides a robust cryptographically based, PIN protected and standalone solution that does not require ongoing availability of the mobile network.

Salt mCodeXpress is available for download through the Apple iTunes App Store for iOS devices, Google Play store for Android, BlackBerry App World, and Microsoft Windows Store for Windows Phone 8 devices.

About Salt Group

Salt Group is an Australian IT Security company helping businesses and organisations with their electronic service delivery needs. We pay particular attention to securing internet and mobile delivery channels across a range of business sectors and application areas.

We are continually developing and extending our Salt Mobile product suite by incorporating emerging technologies, such as contactless Near Field Communication (NFC) for authentication and mobile payments.

We work with financial services, large corporates and government to develop strategies and design solutions to enable businesses to better manage their risks and obligations in delivering electronically.
